FSDL
ASSIGNMENT-03

AIM:-
To design a user input form and perform client side form validation using Javascript to ensure correctness and completeness of data.

Learning Objectives:-
- Design HTML forms
- Understand client-side scripting
- Validate user inputs
- Display error messages

FAQs:-
Q) What is client-side scripting?
→ Client side validation checks the users' input in the browser before sending data to the server.

Q) Difference between client-side and server-side scripting.
→ Client - Happens in the browser using JS. Fast but less secure
Server - Happens on server after form submission.

Q) What is DOM?
→ It is a programming interface that represents the HTML docs as a tree structure.

Q) Why is JS used for validation?
→ Javascript is used because it runs in the browser and can:
- instantly checks user input.

FOR EDUCATIONAL USE
Sundaram

Shows error messages immediately
Prevent form submission if data is invalid.

CONCLUSION:-
Thus, a form validation was successfully implemented.

ASSIGNMENT-3

THEORY:-

Form validation is the process of checking whether the input provided by the user is valid or not. Javascript is commonly used for client-side validation, which improves user experience by providing immediate feedback without sending data to server.

Client-side validation helps reduce server load and ensures that incorrect or incomplete data is not submitted.
